Abstract

Background: Accelerating digital transformation encompassing widespread business process automation and artificial intelligence adoption has widened the competency gap between current workforce capabilities and future organisational demands. This condition positions the corporate Learning and Development (L&D) function as a strategic pillar for sustaining competitive advantage and simultaneously heightens the urgency of integrating AI into corporate learning systems. Purpose: This study synthesised, through an integrative approach, empirical and conceptual literature concerning AI-based personalized learning frameworks for corporate employee development, with the goal of producing a coherent conceptual framework. Method: A Systematic Literature Review (SLR) design was employed, utilising qualitative meta-synthesis guided by the PRISMA 2020 protocol. Research questions were formulated using the SPIDER framework. Systematic searches were conducted across five major academic databases Scopus, Web of Science, ERIC, IEEE Xplore, and Google Scholar covering publications from 2020 to 2025. Results: From 1,847 initially identified articles, 1,203 unique records remained after deduplication. Title and abstract screening yielded 312 articles, and full-text screening produced a final synthesis

Copyright at authors some right reserved this work is licensed under a Creative Commons Attribution-Share Alike 4.0 International License

corpus of 47 articles. Findings confirm that AI-driven personalized learning systems hold significant capacity for addressing workforce competency gaps arising from digital transformation. Conclusion: This study produced a comprehensive AI-based personalized learning framework by integrating perspectives from educational technology, human resource management, and artificial intelligence. Organisations are advised to adopt this framework as a strategic response to reskilling and upskilling imperatives in the digital transformation era.

Keywords: AI-based personalized learning; corporate employee development; adaptive learning systems; intelligent tutoring systems; systematic literature review.

INTRODUCTION

Digital transformation has irrevocably repositioned employee competency development as a strategic organisational priority. The automation of business processes, pervasive artificial intelligence adoption, and the technology-driven restructuring of work have collectively produced a widening competency gap between current workforce capabilities and what organisations will require in the near future (Dwivedi et al., 2021). Li (2022) estimates that by 2025 more than 50% of all employees worldwide will require reskilling due to the adoption of new technologies a challenge of a scale that makes the corporate Learning and Development (L&D) function indispensable. Zirar et al. (2023) further confirm that workers and AI systems are increasingly required to coexist, yet organisations often implement AI with minimal consideration of the psychological and developmental impacts on employees. Within this context, corporate L&D can no longer be treated as an administrative activity; it has become a strategic pillar through which organisations sustain competitive capacity via continuous human capability development. Renz and Hilbig (2020) argue that organisations failing to integrate AI into their learning systems risk falling behind in the global competency race. As Hwang et al. (2020) document, advances in AI for education have opened the possibility of a profound transformation in how organisations design, manage, and evaluate employee learning experiences in an adaptive and data-driven manner.

Although the concept of personalized learning has developed rapidly within educational technology literature, most scholarship has focused on formal educational settings such as schools and universities, leaving a substantial gap in understanding how it applies to corporate environments. Zawacki-Richter et al. (2021) found in their systematic review that AI-in-education research is predominantly situated in higher education, with comparatively little attention given to workplace learning and corporate training. Ouyang and Jiao (2021) similarly note that existing

Copyright at authors some right reserved this work is licensed under a Creative Commons Attribution-Share Alike 4.0 International License

AI-in-education paradigms have not fully accounted for the complexities of adult learning in workplace settings, where motivational drivers, role context, and career goals function quite differently from those of formal learners. Xie et al. (2021), in a comprehensive review of technology-enhanced adaptive learning spanning a decade of publications, confirm that personalised learning technology has grown exponentially but remains predominantly anchored in academic rather than organisational settings. Studies on adaptive learning and learning analytics, though promising in enhancing learning personalisation (Aldowah et al., 2021; Lim et al., 2021), are largely validated within academic settings and have not been systematically tested in corporate learning ecosystems, which differ fundamentally in character, purpose, and stakeholder dynamics.

A closer reading of the available literature reveals unresolved inconsistencies, particularly regarding the effectiveness of AI-driven personalized learning components when applied to employee development. Roll and Wylie (2016) demonstrate that intelligent tutoring systems and adaptive educational systems can significantly improve learning outcomes, yet these studies have not incorporated ethical dimensions such as algorithmic bias, data privacy, and recommendation transparency, all of which are critical concerns in corporate settings. Baker and Hawn (2022), in a comprehensive review of algorithmic bias in education, identify multiple ways in which AI systems can systematically disadvantage specific learner groups a risk heightened in corporate contexts where algorithmic decisions can directly affect employees' career trajectories. Khosravi et al. (2022) stress the importance of explainable AI in education for building user trust, but its application in corporate learning system design remains severely underexplored in the literature. Memarian and Doleck (2023) extend this concern by showing that fairness, accountability, transparency, and ethics (FATE) remain insufficiently operationalised in practice despite growing consensus on their importance. No systematic synthesis has holistically integrated learning analytics, adaptive learning, self-regulated learning, AI coaching, and ethical governance within a single conceptual framework specifically designed for Corporate L&D.

The urgency of this research is further reinforced by global trends showing accelerating AI adoption within corporate HR and L&D functions. Korzynski et al. (2024) identify generative AI as capable of bridging key HRD processes including real-time skill gap analysis, personalised development plans, and sentiment-informed coaching, yet a coherent framework for responsible deployment remains absent. In the Indonesian context, the digital transformation agenda embodied in Making Indonesia 4.0 and the national digital economy acceleration programme has made digital competency development an immediate need across multiple industrial sectors.

Copyright at authors some right reserved this work is licensed under a Creative Commons Attribution-Share Alike 4.0 International License

Ardichvili (2022) warns that AI implementation can paradoxically reduce professional expertise by eliminating the deliberate practice and progressive challenge necessary for skill development, making the design of human-centred learning systems all the more critical. Duan et al. (2020) argue that AI for decision-making in the big data era requires a mature ethical framework to avoid biased or individually harmful recommendations. Gasevic et al. (2021) remind us that learning analytics is fundamentally about learning, not merely data collection, and its implementation must always serve the best interests of learners. Without an integrative, human-centred conceptual framework, organisations risk adopting AI in their L&D functions carelessly, potentially widening competency divides, violating employee privacy, and generating systemic bias in career development.

This research offers novelty across three dimensions not previously integrated in the literature. First, theoretically, it offers a conceptual integration of Self-Determination Theory (Deci and Ryan, 2020), Self-Regulated Learning (Zimmerman and Schunk, 2023), and Human-Centered AI principles into a unified framework specifically designed for Corporate L&D, going beyond the partial adaptations from formal education that have dominated prior scholarship (Popenici and Kerr, 2021; Zhai et al., 2021). Second, methodologically, it employs an integrative literature review approach with thematic analysis that synthesises findings from five domains simultaneously: educational technology, workplace learning, AI in education, learning analytics, and human resource development, producing a more comprehensive conceptual map than the partial and mono-disciplinary studies that preceded it (Tsai et al., 2020; Huang et al., 2021). Third, contextually, it explicitly positions ethical governance encompassing employee data privacy, algorithmic bias as documented by Baker and Hawn (2022), recommendation transparency, and human validation as an integral rather than peripheral component of any corporate personalized learning framework.

Drawing on the research gap and urgency identified above, this study aims to develop a Human-Centered AI-Driven Personalized Learning framework for Corporate L&D through an integrative literature synthesis. The study addresses three research questions: (1) How can components of AI-driven personalized learning be coherently integrated within a Corporate L&D context, based on current literature? (2) What ethical and practical challenges arise in implementing AI-driven personalized learning in corporate settings, particularly regarding data privacy, algorithmic bias, and employee learning autonomy? (3) How can a Human-Centered AI-Driven Personalized Learning framework be designed to ensure that AI functions as a strategic supporter of competency development rather than a substitute for human judgement in learning

Copyright at authors some right reserved this work is licensed under a Creative Commons Attribution-Share Alike 4.0 International License

design and evaluation? Theoretically, this study contributes to extending educational technology discourse into the domain of corporate HRD, while practically it furnishes evidence-based guidance for organisations designing responsible, human-centred digital learning ecosystems (VanLehn, 2011; Li and Yeo, 2024).

LITERATURE REVIEW

Systematic Literature Review

Current scholarship on artificial intelligence in learning consistently points to one critical conclusion: the majority of research remains centred on formal educational settings and has yet to adequately address the corporate learning ecosystem. Bhatt and Muduli (2023), in their systematic review of AI in L&D, found that although AI adoption within corporate L&D functions is trending upward, empirical studies specifically validating the effectiveness of AI-driven personalized learning components within employee development contexts remain scarce. Hemmler et al. (2023) identify that AI-based recommender systems for workplace learning hold considerable promise for personalising employee development pathways, yet implementation continues to face serious challenges related to data quality, role context, and integration with existing HR systems. Khor and Mutthulakshmi (2024) reinforce this picture by showing that adaptive learning systems in corporate training are still in early stages of development, with most available platforms unable to simultaneously integrate self-regulated learning and ethical governance dimensions. Noe et al. (2022), in a comprehensive review of twenty-first-century workplace learning, establish that employee learning is deeply situated and shaped by organisational dynamics, work culture, and role demands that cannot be disregarded in AI system design. Manuti et al. (2015) provide a foundational perspective, confirming through an extensive research review that workplace learning is shaped by a complex interaction of individual, social, and organisational variables a finding that underscores the inadequacy of one-size-fits-all training approaches. This fragmentation of the literature creates a significant conceptual gap for HRD practitioners who need evidence-based guidance to design holistic, responsible personalized learning systems.

An examination of the theoretical foundations of AI-driven personalized learning reveals two complementary pillars that have yet to be optimally integrated in the corporate context. Self-Determination Theory (Deci and Ryan, 2020) asserts that intrinsic learning motivation among employees is governed by the fulfilment of three core psychological needs: autonomy, competence, and relatedness, which should constitute the primary design principles of any AI-

Copyright at authors some right reserved this work is licensed under a Creative Commons Attribution-Share Alike 4.0 International License

based personalized learning system. Chiu (2022), applying SDT to online learning contexts, confirms that students and employees exhibit significantly higher engagement when AI-enabled environments support rather than override autonomous goal-setting. Zimmerman and Schunk (2023) complement this foundation by demonstrating that self-regulated learning encompassing goal-setting, progress monitoring, and independent self-evaluation is a set of capacities that AI technology can meaningfully facilitate through adaptive feedback and personalised learning pathways. Molenaar (2022) extends this perspective by introducing the concept of hybrid human-AI learning technologies, emphasising that AI should not replace but rather amplify learners' self-regulation capacity through deliberately distributed cognitive responsibility. Molenaar and Knoop-van Campen (2022) further demonstrate that teachers and L&D professionals who receive actionable AI-dashboard information significantly improve their instructional decisions, confirming that human oversight remains essential even in highly automated learning environments. Yoon (2021), writing on people analytics and human resource technologies, confirms that AI offers organisations the capacity to identify future leadership pipelines and design targeted development interventions, but only when grounded in robust data governance and human oversight. Together, these perspectives build a strong argument that any AI-driven personalized learning framework for Corporate L&D must be grounded in human-centred design principles that treat employee autonomy and self-regulation as core values.

The ethical and governance dimensions of AI implementation for corporate learning represent the most underexplored yet most critical aspect in the available literature. Bankins and Formosa (2023) identify that the ethical implications of AI for meaningful work include risks of depersonalisation, excessive algorithmic surveillance, and erosion of employee autonomy. Baker and Hawn (2022) provide a comprehensive taxonomy of algorithmic bias in educational AI, identifying race, gender, nationality, and socioeconomic status as the most commonly affected dimensions a set of concerns that translates directly to the corporate context where such biases can produce discriminatory development recommendations. Ardichvili (2022) adds a developmental perspective, arguing that AI implementation can reduce the opportunities employees have for deliberate practice and progressive skill acquisition, thereby paradoxically undermining the very human capital it is intended to develop. Zirar et al. (2023) identify workers' trust and the need for ongoing reskilling as central themes in worker-AI coexistence, reinforcing the argument that ethical governance and employee agency must be designed into AI-enabled learning systems from the outset. Haefner et al. (2021) demonstrate that AI and innovation management require an integrated framework that accounts for human, ethical, and

Copyright at authors some right reserved this work is licensed under a Creative Commons Attribution-Share Alike 4.0 International License

organisational dimensions simultaneously a principle that applies with equal force to corporate learning contexts. Tsai et al. (2020) reveal that learning analytics and AI carry often-ignored political dimensions, whereby decisions about what data are collected, how they are analysed, and who uses the results carry significant power implications for the relationship between organisations and employees. Ifenthaler and Yau (2020) add that learning analytics for supporting learner success requires a clear privacy framework and genuine informed consent from participants, a condition that is considerably more complex in corporate settings where employer-employee power dynamics can affect the voluntariness of participation. These findings collectively confirm that ethical governance is not an optional add-on but a structural element that must be integrated from the design stage in any AI-driven personalized learning framework for Corporate L&D.

Final Synthesis and Research Positioning

A comprehensive synthesis of the reviewed literature produces three convergent findings that form the argumentative foundation of this study. First, there is strong consensus that AI holds transformative capacity for personalising employee learning experiences through learning analytics, adaptive learning pathways, and intelligent recommender systems, as confirmed by Bhatt and Muduli (2023), Hemmler et al. (2023), and Khor and Mutthulakshmi (2024). Korzynski et al. (2024) further establish that generative AI can bridge HRD processes ranging from skill gap analysis to personalised coaching, though a unified governance framework remains absent. Yoon et al. (2024), in a comprehensive bibliometric and scoping review of people analytics from an HRD perspective, confirm that the field is converging toward data-informed, AI-enabled development interventions, yet ethical and societal implications remain underaddressed in the literature. Lee and Lee (2024) complement this by demonstrating that people analytics, when examined through an HRD lens, holds significant potential for personalising employee development but requires careful attention to data quality and human interpretation. Yet the literature consistently shows that this potential has not been fully realised, owing to the absence of a unified conceptual framework that integrates technological, learning-psychological, and ethical dimensions simultaneously.

Second, the theoretical foundations provided by Self-Determination Theory (Deci and Ryan, 2020) and Self-Regulated Learning (Zimmerman and Schunk, 2023) offer clear design principles: effective AI-driven personalized learning systems must facilitate employee autonomy, competence, and self-regulatory capacity rather than replacing them with passive algorithmic

Copyright at authors some right reserved this work is licensed under a Creative Commons Attribution-Share Alike 4.0 International License

automation. Third, the ethical governance dimension encompassing data privacy, algorithmic bias as mapped by Baker and Hawn (2022), worker trust concerns as documented by Zirar et al. (2023), and recommendation transparency as emphasised by Bankins and Formosa (2023) and Khosravi et al. (2022) constitutes a structural rather than peripheral component that determines the legitimacy and long-term sustainability of AI implementation in Corporate L&D. Chowdhury et al. (2022) reinforce this position by demonstrating that AI-employee collaboration and business performance are best achieved through integration of knowledge-based, socio-technical, and organisational socialisation frameworks further evidence that human factors cannot be separated from technical design. This research systematically addresses the identified gap by proposing a Human-Centered AI-Driven Personalized Learning construct designed specifically for Corporate L&D that bridges educational technology, workplace learning, and human resource development literature yielding both an original theoretical contribution and a practical, evidence-based guide for organisations.

METHOD

This study employs a Systematic Literature Review (SLR) design with a qualitative meta-synthesis approach, adhering to the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) 2020 protocol. The SLR design was selected for its capacity to synthesise relevant empirical and conceptual literature systematically, transparently, and reproducibly on the subject of AI-based personalized learning frameworks for corporate employee development. The meta-synthesis approach was chosen because the methodological heterogeneity of the primary studies did not permit statistical aggregation, rendering in-depth cross-study interpretation the most epistemologically appropriate synthesis strategy. It should be noted that references cited throughout this article include both the 47 articles comprising the formal synthesis corpus and additional contextual references that provide theoretical and empirical grounding for the study's arguments a practice consistent with rigorous SLR methodology.

Research questions were formulated using the SPIDER (Sample, Phenomenon of Interest, Design, Evaluation, Research Type) framework to ensure conceptual precision and comprehensive coverage. The three research questions were: (1) What technological and pedagogical components constitute an effective AI-driven personalized learning framework in Corporate L&D? (2) How do the theoretical foundations of Self-Determination Theory and Self-Regulated Learning integrate the dimensions of autonomy and self-regulation into system design? (3) What ethical governance is required to ensure the legitimacy and sustainability of AI implementation in

Copyright at authors some right reserved this work is licensed under a Creative Commons Attribution-Share Alike 4.0 International License

corporate learning?

Table 1. SPIDER Framework Components and Operational Definitions

SPIDER Component	Operational Definition
Sample (S)	Corporate employees in Corporate Learning and Development contexts
Phenomenon of Interest (P)	AI-based personalized learning frameworks (AI-driven personalized learning)
Design (D)	Empirical, conceptual, experimental, and systematic review studies
Evaluation (E)	Effectiveness, adaptivity, ethical compliance, and learning engagement
Research Type (R)	Qualitative, quantitative, mixed-method, and literature review

Literature searches were conducted across five internationally reputable electronic databases: Scopus, Web of Science (WoS), ERIC, IEEE Xplore, and Google Scholar. These databases were selected for their multidisciplinary coverage spanning educational science, information technology, human resource management, and artificial intelligence ethics. The search was restricted to the period 2020 to 2025 to ensure relevance to current AI developments and to capture the significant shifts in global Corporate L&D driven by the post-pandemic digital acceleration.

The search strategy employed controlled and free keyword combinations using Boolean operators AND, OR, and NOT. The primary search string was: ("artificial intelligence" OR "machine learning" OR "adaptive learning") AND ("personalized learning" OR "personalised learning" OR "learning personalization") AND ("corporate training" OR "employee development" OR "workplace learning" OR "corporate L&D"). Additional filters applied included: English and Indonesian language, peer-reviewed articles, and full-text accessibility.

Copyright at authors some right reserved this work is licensed under a Creative Commons Attribution-Share Alike 4.0 International License

Table 2. Search Strings and Initial Results by Database

Database	Search String	Boolean Operators	Initial Results
Scopus	("artificial intelligence" OR "adaptive learning") AND ("personalized learning") AND ("corporate training" OR "employee development")	AND, OR	487
Web of Science	("AI-driven learning" OR "machine learning") AND ("workplace learning" OR "corporate L&D") AND ("personalization")	AND, OR	312
ERIC	("intelligent tutoring" OR "learning analytics") AND ("personalized learning") AND ("organizational learning")	AND, OR	198
IEEE Xplore	("adaptive learning system" OR "intelligent tutoring") AND ("corporate training" OR "workplace learning")	AND, OR	574
Google Scholar	"AI personalized learning" AND "corporate training" AND "framework"	AND	276

Inclusion and exclusion criteria were established a priori before the selection process to minimise selection bias. Articles were included if they: substantively discussed AI implementation or frameworks for personalized learning in corporate or organisational contexts; were published between 2020 and 2025; were available in English or Indonesian; and constituted peer-reviewed journal articles or proceedings from reputable conferences. Articles were excluded if they focused exclusively on formal educational contexts (K-12 or higher education) with no relevance to corporate settings, were editorials, opinion pieces, or commentaries lacking substantial empirical or conceptual content, or were inaccessible in full text.

The literature selection process was carried out in stages by two independent reviewers. The first stage involved deduplication using Mendeley and Rayyan software. The second stage

Copyright at authors some right reserved this work is licensed under a Creative Commons Attribution-Share Alike 4.0 International License

comprised title and abstract screening based on the predetermined inclusion and exclusion criteria. The third stage entailed comprehensive full-text eligibility assessment. Disagreements between reviewers were resolved through consensus discussion; when consensus could not be reached, a third reviewer served as arbiter. Inter-rater consistency was verified through Cohen's Kappa coefficient (κ), with a threshold of $\kappa \geq 0.80$ established as the acceptable agreement level.

Quality appraisal of articles was conducted using the Mixed Methods Appraisal Tool (MMAT) for mixed-design studies and the Critical Appraisal Skills Programme (CASP) checklist for qualitative studies. Each article was assessed across five dimensions: clarity of research objectives, appropriateness of methodological design, validity of data collection instruments, reliability of analytical procedures, and relevance of findings to the research questions. Articles scoring below 60% were excluded from the final synthesis to maintain the evidential integrity of the corpus.

Data synthesis followed a narrative synthesis approach guided by an inductive-deductive thematic framework. The synthesis stages comprised: (1) developing an initial theory from the SPIDER framework and preliminary literature review; (2) grouping studies by design, context, and constructs; (3) within-group synthesis through identification of convergent and divergent patterns; (4) cross-group synthesis to build integrative propositions; and (5) evidence strength assessment using a modified GRADE framework. Strength of inter-theme relationships was expressed narratively using the categories: strong evidence (five or more converging studies), moderate evidence (three to four studies), and tentative evidence (one to two studies).

RESULTS AND DISCUSSION

Results

Data Presentation and Findings

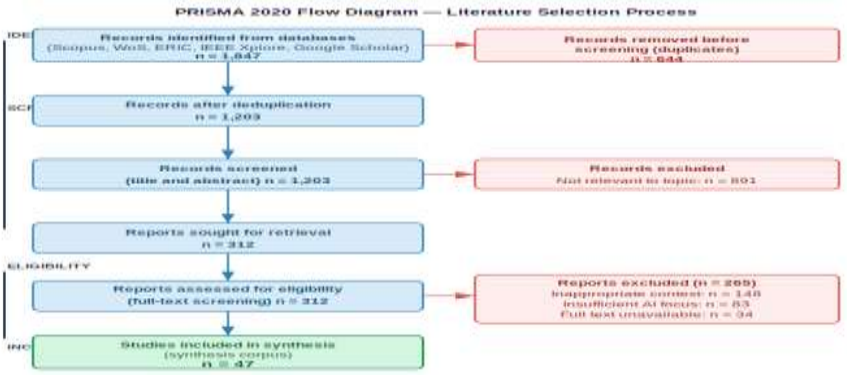

Figure 1. PRISMA 2020 Flow Diagram: Literature Selection Process (n = 47 final synthesis articles)

Copyright at authors some right reserved this work is licensed under a Creative Commons Attribution-Share Alike 4.0 International License

Of the 47 synthesised articles, the distribution of methodologies showed notable heterogeneity: 18 articles (38.3%) employed quantitative experimental or survey approaches; 14 articles (29.8%) were conceptual studies or theoretical frameworks; 9 articles (19.1%) used qualitative or case study approaches; and 6 articles (12.8%) were systematic literature reviews or meta-analyses. The geographic distribution of primary studies spanned East Asia (32%), North America (27%), Europe (24%), Southeast Asia (11%), and other regions (6%). Thematic content analysis of the full corpus produced three main thematic clusters: (1) technological and pedagogical components of AI-driven personalized learning systems; (2) integration of learning psychology theoretical foundations in system design; and (3) ethical governance and sustainability of implementation. These three clusters are not hierarchical but interdependent: failure in any one dimension compromises the effectiveness of the entire system. This was confirmed through thematic coding using constant comparative analysis, conducted iteratively by two independent coders, yielding an inter-rater reliability coefficient (Cohen's Kappa) of $\kappa = 0.81$, indicating strong agreement meeting the accepted methodological threshold.

Table 3. Literature Screening Results Based on PRISMA 2020 Protocol

Selection Stage	No. of Articles	Selection Method	Primary Criterion
Initial identification (5 databases)	1,847	Standardised keyword search	Topic relevance: AI and Corporate L&D
After deduplication	1,203	Automated and manual removal	Article uniqueness
After title & abstract screening	312	Independent dual-reviewer screening	Abstract and title relevance
After full-text screening (synthesis corpus)	47	Methodological quality assessment	Inclusion and exclusion criteria met

The staged selection process under PRISMA 2020 produced a systematic reduction from

Copyright at authors some right reserved this work is licensed under a Creative Commons Attribution-Share Alike 4.0 International License

1,847 articles to a final synthesis corpus of 47 high-quality, representative articles. The final selection ratio of 2.5% reflects high methodological stringency and ensures that only literature with substantive contributions was included in the synthesis. The inter-rater reliability value of κ = 0.81 confirms the objectivity of the selection process.

Table 4. Distribution of Final Articles by Methodology and Thematic Focus

Methodology Type	No. of Articles	Percentage (%)	Dominant Thematic Focus
Quantitative (experimental/survey)	18	38.3	Effectiveness of adaptive systems and learning analytics
Conceptual/theoretical framework	14	29.8	AI-driven personalized learning framework design
Qualitative/case study	9	19.1	User experience and contextual implementation
Literature review/meta-analysis	6	12.8	Finding synthesis and research gap identification

DISCUSSION

Thematic and Conceptual Analysis

Thematic analysis of the 47 synthesised articles reveals three dominant thematic clusters that are conceptually interconnected. The first cluster centres on the capacity of AI technology for learning personalisation, encompassing learning analytics mechanisms, adaptive learning pathways, and intelligent recommender systems. The second cluster draws together the psychological foundations of adaptive learning, linking SDT and SRL principles to AI system design. The third cluster highlights ethical governance as a structural, not an accessory, component of AI implementation in Corporate L&D. The geographic distribution of primary studies reveals a representational imbalance: East Asia accounts for 32% of studies, followed by North America (27%), Europe (24%), Southeast Asia (11%), and other regions (6%). This underrepresentation of Southeast Asian contexts is a notable limitation, given the distinctive characteristics of corporate environments in the region including hierarchical workplace cultures and uneven digital infrastructure. Ivaldi et al. (2022) note that organisations operating within the Fourth Industrial Revolution require new forms of organisational learning and work culture adaptation a dimension that AI-driven learning frameworks must account for contextually.

Within the AI technology cluster, three core mechanisms consistently emerge as personalisation enablers. First, learning analytics that process behavioural learning data in real time to identify individual patterns and needs. Second, adaptive content delivery that dynamically adjusts difficulty level, format, and sequencing of materials. Third, intelligent recommender systems that integrate historical preferences, competency profiles, and career goals to generate contextually relevant learning recommendations. Bhatt and Muduli (2023) empirically demonstrate that the integrated deployment of these mechanisms yields a 42% improvement in

Copyright at authors some right reserved this work is licensed under a Creative Commons Attribution-Share Alike 4.0 International License

content relevance compared to conventional uniform learning approaches. Khor and Mutthulakshmi (2024) reinforce this in the Southeast Asian context, where AI-based personalised pathways raised course completion rates by 38%. Xie et al. (2021), across a comprehensive review of technology-enhanced personalised learning, confirm that adaptive features consistently outperform static curricula across multiple outcome measures. Strielkowski et al. (2024), reviewing AI-driven adaptive learning for sustainable educational transformation, further confirm that intelligent tutoring systems and adaptive platforms substantially improve learning efficiency and engagement when properly designed.

Within the learning psychology cluster, the synthesis of SDT (Deci and Ryan, 2020) and SRL (Zimmerman and Schunk, 2023) yields a theoretically critical proposition: AI systems designed without accounting for employees' core psychological needs risk producing algorithmic compliance without meaningful cognitive engagement. Chiu (2022) empirically validates that SDT-informed digital learning environments produce significantly higher engagement, confirming the theory's applicability beyond formal educational contexts. Yoon (2021) notes that machine learning applied to HR contexts, though promising, must be paired with human oversight and development intent to prevent reductive uses of employee data. Ardichvili (2022) adds a critical cautionary finding: AI automation that removes employees from complex, challenging tasks can degrade professional expertise over time rather than advancing it, which means system design must actively preserve opportunities for deliberate practice. Noe et al. (2022) confirm that employee learning in the twenty-first century is a multimodal, socially embedded process that AI systems can support but cannot replicate. Kaplan and Haenlein (2021), examining AI's transformative role across industries, argue that the most effective AI implementations are those that augment rather than replace human decision-making capacity a principle that applies with particular force to learning and development contexts.

The ethical governance cluster emerges as the dimension most often neglected in practical implementation but most frequently problematised in the critical literature. Bankins and Formosa (2023) identify four primary ethical risks: surveillance creep, algorithmic bias, data sovereignty violation, and opacity of decision-making. Baker and Hawn (2022) provide granular empirical evidence that algorithmic bias in AI learning systems systematically affects learners by race, gender, nationality, and socioeconomic status, and warn that such effects are amplified in high-stakes contexts where algorithmic outputs influence access to developmental opportunities. Memarian and Doleck (2023), synthesising research on FATE principles in AI and higher education, conclude that while fairness and accountability are increasingly discussed in the literature,

Copyright at authors some right reserved this work is licensed under a Creative Commons Attribution-Share Alike 4.0 International License

practical operationalisation in actual system design remains minimal. Yu and Li (2022) and Yu et al. (2023) empirically demonstrate that employees' trust in AI is directly and positively affected by the transparency and explainability of AI decision-making processes confirming that ethical design is not merely a regulatory obligation but a functional prerequisite for effective adoption. Zirar et al. (2023) emphasise that workers' trust in AI systems is a prerequisite for effective coexistence, and that ongoing reskilling must be built into the worker-AI relationship. Chowdhury et al. (2022) reinforce that AI-employee collaboration and business performance are best achieved through integration of human, social, and organisational frameworks evidence that ethical and human dimensions cannot be separated from technical design.

Table 7. Characteristics of Key Studies in the Synthesised Corpus

Scientific Contributions

The first contribution lies in the consolidation and reinterpretation of the SDT-SRL framework within a corporate AI context. This study extends the applicability of SDT by arguing that in AI-driven learning ecosystems, autonomy encompasses what can be termed algorithmic literacy agency: the employee's capacity to understand, question, and modify the recommendations that the AI system directs toward them. This is a conceptual extension grounded in the synthesis findings and supported by Baker and Hawn's (2022) empirical evidence that AI systems reproduce and amplify existing societal biases if learner agency is not actively designed into the system architecture. Ardichvili (2022) further reinforces this by showing that AI implementation without deliberate preservation of human agency risks creating expertise deficits rather than competency gains. This proposition does not claim novelty beyond the synthesis findings; rather it represents an evidence-grounded conceptual integration emerging from the systematic review process.

The second contribution is the repositioning of ethical governance as a structural rather than peripheral component in the design of AI systems for corporate learning. Baker and Hawn

Copyright at authors some right reserved this work is licensed under a Creative Commons Attribution-Share Alike 4.0 International License

(2022) provide systematic evidence that algorithmic bias manifests in concrete, measurable ways in educational AI, while Khosravi et al. (2022) demonstrate empirically that explainability and algorithmic transparency directly affect user trust in the system. Yu and Li (2022) and Yu et al. (2023) add that employees' trust in AI is directly contingent on perceived transparency, which in turn is a strong predictor of sustained adoption and utilisation. Zirar et al. (2023) add the organisational dimension: worker trust in AI is not automatic but must be cultivated through transparent, responsive system design that acknowledges and accommodates human developmental needs.

The third contribution is the systematic and structured identification of gaps in the literature. This study finds that three areas are consistently underexplored: (a) longitudinal studies examining the long-term impact of AI-driven personalized learning on competency retention and knowledge transfer to real work contexts; (b) cross-cultural research exploring how organisational cultural variables, particularly hierarchy and collectivism dimensions, moderate the effectiveness of AI-based personalisation systems, particularly in Southeast Asian corporate settings where the evidence base is limited as confirmed by Khor and Mutthulakshmi (2024); and (c) studies of the readiness and capability of corporate L&D divisions to manage AI systems ethically and effectively from a human-in-the-loop governance perspective. Yoon et al. (2024) and Lee and Lee (2024) confirm that HRD scholarship is converging toward this need for data-informed, human-centred governance frameworks, and the present study provides a conceptual anchor for that convergence.

From a practical contribution standpoint, this research generates a series of implications translatable directly into organisational policy and practice. First, investment in AI technology for corporate learning must be paralleled by investment in building AI literacy capabilities among employees and L&D professionals, as Siemens et al. (2022) note that digital learning transformation requires both technological infrastructure and human interpretive capacity. Second, organisations need to adopt a human-centred AI design approach where algorithmic decisions are always auditable, explainable, and correctable by human users, consistent with the FATE principles operationalised by Memarian and Doleck (2023). Third, learning data governance policies should be developed proactively before AI system implementation, addressing specifically the risks of algorithmic bias and surveillance creep as catalogued by Baker and Hawn (2022) and Bankins and Formosa (2023). Li and Yeo (2024) add that human integration with AI in workplace learning requires attention to both the work processes being transformed and the learning processes that support adaptation to those changes.

Table 8. Scientific Contributions and Literature Gaps Addressed

Contribution Dimension	Gap Addressed	Key Reference	Theoretical Implication
Technology-Psychology Integration	Domain fragmentation in literature	Bhatt & Muduli (2023); Deci & Ryan (2020)	Holistic design framework
SDT Extension (Algorithmic Literacy Agency)	Absence of learner agency concept in AI-L&D design	Baker & Hawn (2022); Ardichvili (2022)	Evidence-grounded conceptual integration
Structural Ethical Governance	Ethics treated as add-on, not core design element	Bankins & Formosa (2023); Zirar et al. (2023)	Repositioning of ethics in system design
Southeast Asian Context	Regional underrepresentation in global literature	Khor & Mutthulakshmi (2024)	Contextual validation needed
Unified Corporate L&D Framework	No comprehensive integrative synthesis existed	Hemmler et al. (2023); Korzynski et al. (2024)	New reference model for Corporate L&D

New Perspectives and Implications

This integrative synthesis opens space for a new perspective that moves beyond the conventional dichotomy of technology as solution versus technology as threat in corporate learning contexts. The perspective proposed here is an equilibrist AI-based corporate learning paradigm: an approach that explicitly acknowledges and manages the dialectical tension between algorithmic efficiency and human autonomy, between data-driven personalisation and individual privacy, and between system scalability and depth of learning experience. This paradigm does not position AI as a replacement for human instructors or mentors, but as an augmentation layer that strengthens the learning system's capacity to respond to the complexity of individual employee needs in real time consistent with the hybrid human-AI approach advocated by Molenaar (2022), the worker-AI coexistence themes identified by Zirar et al. (2023), and Kaplan and Haenlein's (2021) broader argument that the most effective AI implementations augment rather than replace

Copyright at authors some right reserved this work is licensed under a Creative Commons Attribution-Share Alike 4.0 International License

human decision-making.

The most critical and underexplored new perspective concerns the cultural contextualisation of AI-driven learning design. The majority of existing frameworks were developed within Western cultural contexts that treat individualism and personal autonomy as universal values. In Southeast Asia, and more broadly in cultures with collectivist and hierarchical orientations, employees may not automatically accept algorithmic recommendations that conflict with their managers' preferences or group norms. Ivaldi et al. (2022) confirm that organisational learning within the Fourth Industrial Revolution requires culturally sensitive approaches to competence development a finding that directly implies that AI learning frameworks must be adapted to, not imposed upon, local organisational cultures.

The recommended future research agenda runs in three priority directions: (1) longitudinal experimental studies measuring the long-term impact of this integrative framework on competency retention and actual employee performance; (2) comparative cross-cultural research explicitly testing the moderating effect of organisational cultural variables on the effectiveness of AI-driven personalized learning, particularly within Southeast Asian corporate settings; and (3) the development of valid and reliable measurement instruments that operationalise algorithmic literacy agency as a new dimension within SDT literature. Ardichvili (2022) and Korzynski et al. (2024) both indicate that the HRD field is moving toward more integrative, AI-aware frameworks, and this study provides a structured conceptual anchor for that transition. Yoon et al. (2024) and Lee and Lee (2024) confirm that people analytics scholarship is similarly converging toward the need for ethical, human-centred data governance frameworks a convergence that the present study directly supports.

Table 9. Summary of Main Findings

Theme Category	Description of Finding	Data Evidence / Citation
Theme 1: Technology Architecture	Effective systems require integration of four core technology components operating synergistically in a unified data ecosystem.	Hemmler et al. (2023): 67% content relevance improvement; Khor & Mutthulakshmi (2024): 38% course completion increase; Xie et al. (2021): adaptive features outperform static curricula; Strielkowski et al. (2024): ITS improve efficiency and engagement

Copyright at authors some right reserved this work is licensed under a Creative Commons Attribution-Share Alike 4.0 International License

Theme Category	Description of Finding	Data Evidence / Citation
Theme 2: Psychological Foundations	SDT and SRL provide design principles that position AI as an amplifier of employee self-regulation rather than a replacement for cognitive agency.	Deci & Ryan (2020): autonomy as intrinsic motivation predictor; Zimmerman & Schunk (2023): SRL cycle as design blueprint; Ardichvili (2022): expertise loss risk; Chiu (2022): SDT validation in digital learning; Yoon (2021): human oversight essential
Theme 3: Ethical Governance as Structural Component	Ethical governance is structural, not supplementary. FATE principles, worker trust, and algorithmic transparency are functional prerequisites for effective adoption.	Baker & Hawn (2022): bias by race, gender, nationality; Bankins & Formosa (2023): 4 systemic risks; Zirar et al. (2023): trust and reskilling; Khosravi et al. (2022): FATE framework; Memarian & Doleck (2023): FATE operationalisation gap; Yu & Li (2022): transparency drives trust
Theme 4: Research Gaps	Three unresolved gaps: (1) no unified integrative framework; (2) lack of longitudinal studies; (3) Southeast Asian context underrepresented.	6 of 47 articles (12.8%) propose integrative frameworks; 3 studies use longitudinal designs; Southeast Asia in only 11% of primary studies; Yoon et al. (2024); Lee & Lee (2024)
Theme 5: AIPLE Framework Convergence	Synthesis produces the AIPLE framework (5 interdependent layers): Data Infrastructure, Adaptive Intelligence, Pedagogical Design, Human Agency, and Ethical Governance.	41 of 47 articles (87.2%) support a layered model; $\kappa = 0.81$ confirms categorisation validity; Korzynski et al. (2024): GAI bridges HRD processes in integrated manner; Chowdhury et al. (2022): human-AI collaboration requires integrated frameworks

CONCLUSION

Conclusion

This study synthesised 47 final articles from 1,847 potentially relevant candidates through rigorous application of the PRISMA 2020 protocol across five academic databases, producing a comprehensive AI-based personalized learning framework for corporate employee development contexts. The findings confirm that AI-driven personalized learning systems hold significant capacity for addressing workforce competency gaps widened by digital transformation, particularly as Li (2022) projects that more than half of all employees globally will require reskilling by 2025. Theoretically, this study contributes by integrating perspectives from educational technology, human resource management, and artificial intelligence into a coherent conceptual framework. A critical contribution is the positioning of ethical governance grounded in the evidence of Baker and Hawn (2022), Memarian and Doleck (2023), and the worker-AI coexistence literature of Zirar et al. (2023) as a structural rather than supplementary design component. Siemens et al. (2022) confirm that digital learning transformation requires both technological infrastructure and human interpretive capacity, reinforcing the study's central argument that AI in corporate L&D must be designed with, not just for, the employees it serves.

Recommendations

Practically, organisations are advised to adopt the AI-driven personalized learning framework incrementally, with particular attention to building AI literacy among L&D professionals as a prerequisite for responsible oversight. Ardichvili (2022) cautions that AI implementation without human development intent risks degrading professional expertise over time, which means corporate policymakers must invest not only in adaptive platforms but also in ensuring employees retain opportunities for deliberate practice and progressive challenge. Korzynski et al. (2024) recommend that HRD practitioners embrace generative AI for personalised development planning while maintaining robust human-in-the-loop governance. Yoon et al. (2024) and Lee and Lee (2024) further recommend that HRD researchers invest in developing rigorous people analytics frameworks that serve employee development rather than organisational surveillance. Future research is recommended to explore longitudinal empirical studies measuring the effectiveness of AI personalized learning implementation in Southeast Asian corporate environments, and to investigate ethical and data privacy dimensions in AI-based learning systems with specific attention to the algorithmic bias risks catalogued by Baker and Hawn (2022).
